2.9

DIMENSION AND RANK

COORDINATE SYSTEMS

- Suppose $\beta = \{b_1, \dots, b_p\}$ is a basis for H , and suppose a vector \mathbf{x} in H can be generated in two ways, say,

$$x = c_1b_1 + \dots + c_pb_p \text{ and } x = d_1b_1 + \dots + d_pb_p \quad (1)$$

- Then, subtracting gives

$$0 = x - x = (c_1 - d_1)b_1 + \dots + (c_p - d_p)b_p \quad (2)$$

- Since β is linearly independent, the weights in (2) must all be zero. That is, $c_j = d_j$ for $1 \leq j \leq p$, which shows that the two representations in (1) are actually the same.

COORDINATE SYSTEMS

- **Definition:** Suppose the set $\beta = \{b_1, \dots, b_p\}$ is a basis for a subspace H . For each x in H , the **coordinates of x relative to the basis β** are the weights c_1, \dots, c_p such that $x = c_1b_1 + \dots + c_pb_p$, and the vector in \mathbb{R}^p

$$[x]_\beta = \begin{bmatrix} c_1 \\ \cdot \\ \cdot \\ \cdot \\ c_p \end{bmatrix}$$

- is called the **coordinate vector of x (relative to β)** or the **β -coordinate vector of x** .

COORDINATE SYSTEMS

- **Example 1** Let $v_1 = \begin{bmatrix} 3 \\ 6 \\ 2 \end{bmatrix}$, $v_2 = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$, $x = \begin{bmatrix} 3 \\ 12 \\ 7 \end{bmatrix}$, and $\beta = \{v_1, v_2\}$. Then β is a basis for $H = \text{Span}\{v_1, v_2\}$ because v_1 and v_2 are linearly independent. Determine if x is in H , and if it is, find the coordinate vector of x relative to β .
- **Solution** If x is in H , then the following vector equation is consistent:

$$c_1 \begin{bmatrix} 3 \\ 6 \\ 2 \end{bmatrix} + c_2 \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} 3 \\ 12 \\ 7 \end{bmatrix}$$

COORDINATE SYSTEMS

- The scalars c_1 and c_2 , if they exist, are the β -coordinates of \mathbf{x} . Row operations show that

$$\begin{bmatrix} 3 & -1 & 3 \\ 6 & 0 & 12 \\ 2 & 1 & 7 \end{bmatrix} \sim \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 3 \\ 0 & 0 & 0 \end{bmatrix}$$

- Thus $c_1 = 2$, $c_2 = 3$ and $[\mathbf{x}]_\beta = \begin{bmatrix} 2 \\ 3 \end{bmatrix}$. The basis β determines a “coordinate system” on H , which can be visualized by the grid shown in Fig. 1 on the next slide.

COORDINATE SYSTEMS

FIGURE 1 A coordinate system on a plane H in \mathbb{R}^3 .

THE DIMENSION OF A SUBSPACE

- **Definition:** The **dimension** of a nonzero subspace H , denoted by $\dim H$, is the number of vectors in any basis for H . The dimension of the zero subspace $\{0\}$ is defined to be zero.
- **Definition:** The **rank** of a matrix A , denoted by $\text{rank } A$, is the dimension of the column space of A .

THE DIMENSION OF A SUBSPACE

- **Example 3** Determine the rank of the matrix

$$A \sim \begin{bmatrix} 2 & 5 & -3 & -4 & 8 \\ 0 & -3 & 2 & 5 & -7 \\ 0 & -6 & 4 & 14 & -20 \\ 0 & -9 & 6 & 5 & -6 \end{bmatrix}$$

- **Solution** Reduce A to echelon form:

$$A \sim \begin{bmatrix} 2 & 5 & -3 & -4 & 8 \\ 0 & -3 & 2 & 5 & -7 \\ 0 & -6 & 4 & 14 & -20 \\ 0 & -9 & 6 & 5 & -6 \end{bmatrix} \sim \dots \sim \begin{bmatrix} 2 & 5 & -3 & -4 & 8 \\ 0 & -3 & 2 & 5 & -7 \\ 0 & 0 & 0 & 4 & -6 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Pivot columns 

- The matrix A has 3 pivot columns, so $\text{rank } A = 3$.

THE DIMENSION OF A SUBSPACE

- **Theorem 14** If a matrix A has n columns, then $\text{rank } A + \dim \text{Nul}A = n$.
- **Theorem 15** Let H be a p -dimensional subspace of \mathbb{R}^n . Any linearly independent set of exactly p elements in H is automatically a basis for H . Also, any set of p elements of H that spans H is automatically a basis for H .

RANK AND THE INVERTIBLE MATRIX THEOREM

- **The Invertible Theorem (continued)** Let A be an $n \times n$ matrix. Then the following statements are each equivalent to the statement that A is an invertible matrix.
 - m. The columns of A form a basis of \mathbb{R}^n .
 - n. $\text{Col } A = \mathbb{R}^n$
 - o. $\dim \text{Col } A = n$
 - p. $\text{rank } A = n$
 - q. $\text{Nul } A = \{0\}$
 - r. $\dim \text{Nul } A = 0$

RANK AND THE INVERTIBLE MATRIX THEOREM

- **Proof** Statement (m) is logically equivalent to statements (e) and (h) regarding linear independence and spanning. The other five statements are linked to the earlier ones of the theorem by the following chain of almost trivial implications:

$$(g) \Rightarrow (n) \Rightarrow (o) \Rightarrow (p) \Rightarrow (r) \Rightarrow (q) \Rightarrow (d)$$

- Statement (g), which says that the equation $Ax = b$ has at least one solution for each \mathbf{b} in \mathbb{R}^n , implies statement (n), because $\text{Col } A$ is precisely the set of all \mathbf{b} such that the equation $Ax = b$ is consistent.

RANK AND THE INVERTIBLE MATRIX THEOREM

- The implications $(n) \Rightarrow (o) \Rightarrow (p)$ follow from the definitions of *dimension* and *rank*.
- If the rank of A is n , the number of columns of A , then $\dim \text{Nul } A = 0$, by the Rank Theorem, and so $\text{Nul } A = \{0\}$. Thus $(p) \Rightarrow (r) \Rightarrow (q)$.
- Also, statement (q) implies that the equation $Ax = 0$ has only the trivial solution, which is statement (d).
- Since statements (d) and (g) are already known to be equivalent to the statement that A is invertible, the proof is complete.
